CNT

Porosity (Void Ratio):

☐ Permeable Pavement on Driveways and Alleys
☐ Permeable Pavement on Sidewalks

* Required fields.
+ Must have at least one of these fields filled in.

RESULTS

The Green Stormwater BMP(s) applied in this scenario **decrease** the site impermeable area by **54.3%** and capture **520.1%** of the runoff volume required. Compared to conventional approaches, the green practices in this scenario will **increase** the total life-cycle construction and maintenance costs by **1%** (in net present value).

Volume Control **Coefficients and Runoff** **Land Use** **Costs** **Benefits**

Benefits

	Annual Benefits (\$) Green Benefits	Life Cycle Benefits (\$, NPV) Green Benefits
Reduced Air Pollutants	0	0
Carbon Dioxide Sequestration	0	0
Compensatory Value of Trees	0	0
Groundwater Replenishment	10	313
Reduced Energy Use	360	11,408
Reduced Treatment benefits	5	173
Total	375	11,894

[Detailed benefits sheet.](#)

Costs and Benefits of Infrastructure

- Selecting between green and grey infrastructure practices usually involves only a comparison of the costs of each.
- However, when investing taxpayer dollars, such decisions should consider the relative monetary benefits of green and grey infrastructure as well as their costs.

CNT's “Valuation Guide”

<http://www.cnt.org/repository/gi-values-guide.pdf>

2 – Step Process

1. Quantification of Benefits

2. Valuation of Quantified Benefits

Benefits by GI practice

Practice	Practice Unit	Benefit Units
	Square feet	<ul style="list-style-type: none"> Gallons retained on site KWH treatmt energy saved LBs of pollutant removed
	Tree (canopy %)	Gallons; KWH energy; LBs of pollutant removed
	Square feet	Gallons; KWH energy; LBs removed; decibels
	Square feet	Gallons; KWH saved (HVAC); LBs removed; decibels
	Gallons	Gallons; KWH energy; gallons potable water saved

Types of Benefits

Water – Treatment costs, water quality, stream erosion, flooding, groundwater and stream recharge, drinking water supply, grey infrastructure needs, de-icing

Energy – Building heating/cooling, water pumping, treatment and storage

Air Quality – Pollutant sequestration, carbon sequestration

Climate – Carbon sequestration, other GHGs

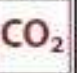

Heat Island – Morbidity, mortality, comfort

Community Livability – Noise, recreation, property value, aesthetics, community cohesion, urban agriculture

Habitat – Biodiversity, ecological health

Public Education

The Value of Reduced Runoff, Energy, Clean Air, Livability

Benefit	Reduces Stormwater Runoff				Increases Available Water Supply	Increases Groundwater Recharge	Reduces Salt Use	Reduces Energy Use	Improves Air Quality	Reduces Atmospheric CO ₂	Reduces Urban Heat Island	Improves Community Livability					Improves Habitat	Cultivates Public Education Opportunities
	Reduces Water Treatment Needs	Improves Water Quality	Reduces Grey Infrastructure Needs	Reduces Flooding								Improves Aesthetics	Increases Recreational Opportunity	Reduces Noise Pollution	Improves Community Cohesion	Urban Agriculture

Yes

Maybe

No

Example: Energy Benefits from a 5,000 S.F. Green Roof (Reduced Energy Use)

Heating degree days (°F days)
x green roof area (SF) x
24 hours/day x ΔU =
Reduced Heating Energy
(Btu/SF)

Where:

U = heat transfer coefficient,
or $1/R$; and

R = a measure of thermal
resistance

Energy Benefits from Green Roof

$$\Delta U = [1/R_{cr} - 1/R_{gr}] = \text{Btu}/11.34(\text{SF})(^{\circ}\text{F})(\text{hrs}) - \text{Btu}/23.4(\text{SF})(^{\circ}\text{F})(\text{hrs})$$

6,630°F(Chicago heating degree days) x 24 hr/day
x $\Delta U = \underline{\underline{7,231.75}}$ (Btu/SF)

Hypothetical:

$$7,231.75 \times 5,000 \text{ SF} = \underline{\underline{36,158,750 \text{ Btu/year}}}$$

Monetizing the Benefits

Energy (cost): 36,158,750 Btu x
\$0.0000123/Btu

= \$444.75 annual savings (5,000 S.F. Roof)

Scaling Up the GI...

Chicago City Hall Green Roof
= 20,300 sq ft

Represents \$1806 in annual energy savings for City (since 2000)

Chicago: Several years ago, there were >2 million sq ft of green roof installed. Based on that, saving building owners would collectively be saving \$177,901/year

Chicago: More recently, we were told >7 million sq ft of green roof completed or under permit review: \$622,654/year in savings.

Cost of

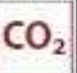

go, IL

Flood damage

- Through Open House phone calls, Chicago's
- That number flooded, since few people call, investigated further:
- One industry estimate puts the number of calls to private contractors in the Chicago region at about 60,000 per year, with the average cost per call at \$2,500 (cleaning and flood-proofing.) That's a total of about \$150 Million annually.
- How would an investment in local green infrastructure compare with these costs?

Cumulative Benefits

Benefit	Reduces Stormwater Runoff				Increases Available Water Supply	Increases Groundwater Recharge	Reduces Salt Use	Reduces Energy Use	Improves Air Quality	Reduces Atmospheric CO ₂	Reduces Urban Heat Island	Improves Community Livability					Improves Habitat	Cultivates Public Education Opportunities
	Reduces Water Treatment Needs	Improves Water Quality	Reduces Grey Infrastructure Needs	Reduces Flooding								Improves Aesthetics	Increases Recreational Opportunity	Reduces Noise Pollution	Improves Community Cohesion	Urban Agriculture

The Economic Benefits of Green Infrastructure

A Case Study of Lancaster, PA

USEPA Study in
Lancaster, PA
2013

CNT Primary
Consultant

Partners:
American Rivers
TetraTech, Inc.
City of Lancaster
CH2M Hill, Inc.
USEPA

(as yet unpublished)

Lancaster, PA Case Study

Green Infrastructure benefits studied were the reductions in:

- Water treatment needs
- Grey infrastructure needs
- Electricity use
- Natural gas use
- Emissions of air pollutants
- CO₂ emissions

Lancaster, PA Case Study

Green Infrastructure practices planned:

- Green roofs
- Tree planting
- Permeable pavement
- Bioretention & infiltration practices
- Water harvesting

Lancaster, PA Case Study

- Results assume Lancaster reaches its long-term, 25-year goal of 1,053,000,000 gallons of reduced average runoff per year (Green Infrastructure Plan).
- Twenty demonstration projects in the Plan are representative of those practices contributing to achievement of Plan goals.
- Total estimated monetary values are those annual monetary benefits accruing at the end of the Plan's 25-year implementation period.

Lancaster, PA Case Study

Water-Related Benefits

1. Avoided cost of wastewater treatment
2. Avoided cost of grey infrastructure

Green roofs, tree planting, permeable pavement, bioretention & infiltration practices, water harvesting

Estimated benefit of avoided costs for wastewater treatment and infrastructure with the installation of GI at the end of the 25-year implementation period is \$122,361,000 per year.

Lancaster, PA Case Study

Energy-Related Benefits

Reduced electricity and natural gas usage

Green roofs, tree planting, water harvesting:
insulation, shading, wind blocking, evaporation

Estimated benefit of reduced energy use through the installation of GI at the end of the 25-year implementation period is \$2,368,000 per year.

Lancaster, PA Case Study

Air Quality-Related Benefits

Reduced emissions of nitrogen dioxide (NO_2), ozone (O_3), sulfur dioxide (SO_2), particulate matter (PM-10)

Trees, green roofs, permeable pavement, and bioretention and infiltration practices: uptake and absorption, reduced energy emissions, reduced O_3

Estimated benefit from reduced air pollutants with the installation of GI at the end of the 25-year implementation period is \$1,023,000 per year.

Lancaster, PA Case Study

Climate Change-Related Benefits

Reduced CO₂

Vegetation and permeability: reduce atmospheric CO₂ through direct carbon sequestration, reduced water and wastewater treatment, reduced energy production.

Estimated benefit from reduced CO₂ with the installation of GI at the end of the 25-year implementation period was \$786,000 per year.

Lancaster, PA Case Study

Additional Benefits

Reduced urban heat island effect, increased property value, reduced noise pollution, increased recreational opportunities, habitat improvement, public education, and community cohesion

Estimated benefit from with the installation of GI at the end of the 25-year implementation period was not calculated.

Calculated Annual Benefits	
Estimated Value from Water Benefits	\$122,361,000
Estimated Value from Energy Benefits	\$2,368,000
Estimated Value from Air Quality Benefits	\$1,023,000
Estimated Value from Climate Change Benefits	\$786,000
Estimated Value from other Qualitative Benefits	Not calculated
TOTAL	\$126,538,000
